

Now It's Easy To Keep Your Family Safe With Backup Power from Tri-County Electric

Standby Generators Offer Comfort, Security and Convenience During A Power Outage

A standby generator is an automatic system that produces electricity as soon as it senses a power outage—24 hours a day, 365 days a year. Installed next to your home, it starts automatically whether you are home or not. Tri-County Electric recommends the Generac standby generator and would like to help you get it at the best possible price.

What's Involved in Installing a Standby Generator?

- To start with, you must already have natural gas or propane service because this is what fuels the standby generators. If it is not already in place, you must be willing to have this installed enabling you to have emergency power regardless of what the weather brings
- The generator needs to be installed by our approved electrician, to run the fuel line, install the transfer switch and make all the necessary electrical connections. Proper installation by Tri-County Electric ensures that your generator is running properly and safely.

A Standby Generator Protects You and Your Home By:

1. Keeping the lights on so you aren't stumbling in the dark.
2. Keeping essential equipment running such as private wells or basement sump pumps.
3. Keeping medicines cold and medical equipment running.
4. Ensuring the security system continues to run.
5. Avoiding home damage by keeping the air conditioning and furnace running.
6. Allowing the use of appliances so food won't spoil and you won't go hungry.
7. Maintaining cellphone battery charge to make calls during emergencies.

How Much Does Everything Cost?

Along with the standby generators, there is a complete line of portable generators. Tri-County Electric will work with you to obtain the best cost-effective generator for your home. Installation costs will vary by system size, installation considerations and local business codes. Tri-County Electric will offer a free in-home assessment to help you figure out these costs.
